Darryl Green Jr

New York, New York green.jr.darryl@gmail.com (248) 697-1746 in/darrylgreenjr darrylgreenjr.com/

Summary

Full-Stack Software Engineer, with five years of experience building scalable web applications, architecting reusable component systems, and driving privacy compliance. Specialized in modern JavaScript development and ecosystems (e.g. React, Next.js, Vue.js, TypeScript) all while leveraging AI-assisted development such as GitHub Copilot to accelerate delivery.

Skills

Languages: JavaScript, TypeScript, Python, SQL, HTML5, CSS, Java

Frameworks: React.js, Next.js, Vue.js, Jest, Playwright

Tools: Amazon Web Services, Yarn, NPM, Git, GitHub Copilot, Claude Code, Jenkins CI/CD, Postman

Databases: MySQL, PostgreSQL

Experience

The Washington Post

New York, NY

Software Engineer II *November 2022 - Present*

- Implemented a comprehensive RESTful privacy API on The Washington Post website, consolidating privacy protocols across dozens of projects and reducing future update requirements by an estimated 90%+, while ensuring consistent data privacy compliance.
- Led a cross-functional Agile team to sunset tracking cookies across nearly all WaPo surfaces, closing gaps identified in legal's GDPR compliance review; leveraged AI-assisted development to manage refactoring across 15+ repositories sitewide.
- Partnered with legal to identify and remediate compliance gaps across all of WaPo's systems, averting an estimated $3-10M in potential litigation exposure (per legal/leadership risk assessment).
- Rebuilt cookie consent management interface to close gaps in data privacy regulatory compliance, proactively reducing regulatory violation risk across regulations such as the European Union's GDPR and multiple state-level laws (e.g., CCPA, Virginia CDPA).
- Streamlined footer updates by developing a shared HTML Web Component, eliminating redundant tasks and reducing needed developers by at least five.
- Authored Engineering Resource Documents (ERDs) and conducted post-mortem analyses for completed projects, establishing standardized testing protocols and release procedures adopted across the team, streamlining onboarding and reducing deployment risk.
- Accelerated feature implementations through strategic deployment of AI development tools, including GitHub Copilot, across the Washington Post codebases.
- **Tools:** React.js, Next.js, TypeScript, Playwright, Jest, GitHub Copilot, Claude AI, HTML Web Components, Jenkins CI/CD, Amazon Web Services.

Michigan Aerospace Corporation

Ypsilanti, Michigan

Software Engineer *June 2021 - September 2022*

- Architected a comprehensive library of modular Vue.js UI components, significantly reducing development time for new features and ensuring uniform user experience across diverse application modules.
- Completed a Profile page redesign, resolving issues with malformed fields, broken validation and increasing data accuracy and reliability ahead of the subscription model launch.
- Developed automated unit and integration testing suites for Springmatter application using Jupyter Notebook and Python Selenium, catching regressions earlier in the development cycle and reducing bug-related production delays.
- Engineered a Python-based tool for Michigan DNR's water turbidity initiative that converted image deployments into video, significantly accelerating analysis and improving data accuracy for the research team.
- Contributed to a camera-deployment application built for Michigan State University researchers, developing scoring logic that assigned species-match confidence likelihoods to field-captured images, feeding structured data into an LLM trained to identify endangered species from dozens of camera sites statewide.
- Integrated weekly testing suites simulating user interaction before deploying feature updates and fixes to the production application; shaved testing execution time by 30 minutes through test automation enhancements.
- **Tools:** JavaScript, Python, Vue.js, HTML/CSS, Selenium, Jupyter Notebook.

Brooksource

Remote

Software Engineer (Contract — Ford Motor Credit) *February 2021 - May 2021*

- Paired and mob-programmed daily with team members to debug and extend an existing Angular front-end, building solutions that met acceptance criteria for functionality, scalability, and performance.
- Performed weekly software testing and code reviews to catch bugs and resolve issues prior to production launches.
- Engineered and deployed client-server A/B testing using Angular and Spring Boot, improving conversion rates by 15% through experiment-driven enhancements.
- **Tools:** HTML/CSS, JavaScript, Java, TypeScript, Angular, Postman, Jenkins CI/CD, IntelliJ, NPM, Git.

Education

Bachelor of Arts in Computer Science

Detroit, MI

Wayne State University *2020*
